No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   **SIDS2/gcgdata/geneseq/geneseqn-embl/Na1980.DAT:*

repeats, H1 and H4 domains and a cysteine rich domain of

```
The present invention relates to an isolated nucleotide sequence encoding a dystrophin minigene. The minigene comprises N-terminal or modified N-terminal domains, rod repeats, utrophin or a spectrin gene, HI and H4 domains and cysteine-rich domains of dystrophin or utrophin genes. The invention also relates to a recombinant adeno-associated virus (AAV) element. The dystrophin minigene operably linked to an expression control element. The dystrophin minigene in operable linkage with an expression scontrol element, in a recombinant adeno-associated virus or retrovirus is control element, in a recombinant adeno-associated virus or retrovirus is useful for treating Duchenne muscular dystrophy (DMD) and Becker muscular dystrophy (BMD) in a mammalian subject. The present sequence is human dystrophy hand fragment encoding rods R23 and R24, hinge H4 and CR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       601 GCAGCIGCATGAAGCCCACAGGGACTIIGGICCAGCAICICAGCACITICITICCACGIC 660

The present invention relates to an isolated nucleotide sequence encoding a dystrophin minigene. The minigene comprises N-terminal or modified N-terminal domains, rod repeats, utrophin or a spectrin game, H1 and H4 domains and cysteine-rich domains of dystrophin or utrophin genes. The domains and cysteine-rich domains of dystrophin or utrophin genes. The comprising dystrophin minigene operably linked to an expression control element, in a mammal in operable linked with an expression control element, in a recombinant adeno-associated virus or retrovirus is useful for treating Duchenne muscular dystrophy (DMD) and Becker muscular dystrophy (BMD) in a mammalian subject. The present sequence is human dystrophin minigene delta3510 containing nucleotides 1-1668 (N-terminus, hinge H1 and rods R1 and R2), 8407-10227 (rods R23 and R24, hinge H4 and CR domain) and 11047-11058 (dystrophin last 3 amino acids). New dystrophin minigene for treating Duchenne or Becker muscular dystrophy comprises an N-terminal domain or modified N-terminal domain, rod repeats, H1 and H4 domains and a cysteine rich domain of a Example 1; Page 51-52; 71pp; English. dystrophin gene ·

The present invention relates to an isolated nucleotide sequence encoding a dystrophin minigene. The minigene comprises N-terminal or modified N-terminal domains, rod repeats, utrophin or a spectrin gene, HI and H4 domains and cysteine-rich domains of dystrophin or utrophin genes. The invention also relates to a recombinant adeno-associated virus (AAV) comprising dystrophin minigene operably linked to an expression control element, in a mammalian adostrophy (DMD) and Becker muscular dystrophin minigene muscular dystrophy (DMD) and Becker muscular dystrophin minigene elita3849 containing nucleotides 1.1668 (N-terminus, hinge HI and rods RI, R2), 8059-10227 (rods R22, R23 and R24, hinge H4 and CR domain) and 11047-11058 (dystrophin last 3 amino acids).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    2427 CCAGGAACTTCAAGAGGCCACGGATGAGCTGGACCTCAAGCTGCGCCAAGCTGAGGTGAT 2486

New dystrophin minigene for treating Duchenne or Becker muscular dystrophy comprises an N-terminal domain or modified N-terminal domain, rod repeats, H1 and H4 domains and a cysteine rich domain of a dystrophin gene

The present invention relates to an isolated nucleotide sequence encoding a dystrophin minigene. The minigene comprises N'terminal or modified N'terminal domains, rod repeats, utrophin or a spectrin gene, HI and H4 invention also relates to a recombinant adeno-associated virus (AAV) comprising dystrophin minigene operably linked to an expression control element. The dystrophin minigene operably linked to an expression control control element, in a recombinant adeno-associated virus or retroviculated virus or retroviculated to an expression useful for treating buchenne muscular dystrophy (BMD) in a mammalian subject. The present sequence is human hinge HI and rods RI and R2), 8055-10227 (rods R22, R23 and R24, hinge H4 and CR domain) and 11047-11058 (dystrophin last 3 amino acids).

The present invention relates to an isolated nucleotide sequence encoding a dystrophin minigene. The minigene comprises N-terminal or modified N-terminal domains, rod repeats, utrophin or a spectrin gene, H and H4 domains and oysteine-rich domains of dystrophin or utrophin genes. The invention also relates to a recombinant adeno-associated virus (AAV) comprising dystrophin minigene operably linked to an expression control element, in a recombinant adeno-associated virus or retrovirus is useful for treating Duchenne muscular dystrophy (DMD) and Becker muscular dystrophy (BMD) in a mammahlian subject. The present sequence is human dystrophin minigene delta4173 containing nucleotides I-1992 (N-terminus, hinge H1 and rods R1, R2 and R3), 8059-10227 (rods R22, R23 and R34, hinge H4 and CR domain) and 11047-11058 (dystrophin last 3 amino acids).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                2631 AGCCCAGAATGTCACTCGGCTTCTACGAAAGCAGGCTGAGGAGGTCAAGATACTGAGTGGGA 2690

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             δλ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to an isolated nucleotide sequence encoding a dystrophin minigene. The minigene comprises N-terminal or modified N-terminal domains, rod repeats, utrophin or a spectrin gene, H1 and H4 domains and cysteine-rich domains of dystrophin or utrophin genes. The invention also relates to a recombinant adeno-associated virus (AAV) comprising dystrophin minigene operably linked to an expression control control element. The dystrophin minigene in operable linkage with an expression control control element, in a recombinant adeno-associated virus or retrovirus is dystrophy (BMD) in a mammalian subject. The present sequence is AAV vector plasmid construct containing human dystrophin minigenes, a muscle creatine kinase (MCK) promoter and a small polya signal sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ·

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to an isolated nucleotide sequence encoding a dystrophin minigene. The minigene comprises N-terminal or modified N-terminal domains, rod repeats, utrophin or a spectrin gene, HI and H4 M-terminal domains, rod repeats, utrophin or a spectrin gene, HI and H4 invention also relates to a recombinant adeno-associated virus (AAV) invention also relates to a recombinant adeno-associated virus (AAV) element. The dystrophin minigene operably linked to an expression control element. The dystrophin minigene in operable linkage with an expression useful for treating Duchenne muscular dystrophy (BMD) and Becker muscular dystrophy (BMD) in a mammalian subject. The present sequence is AAV vector plasmid construct containing human dystrophin minigenes, a muscle

RESULT 10
```

The present invention relates to an isolated nucleotide sequence encoding a dystrophin minigene. The minigene comprises N-terminal or modified N-terminal domains, rod repeats, utrophin or a spectrin gene, H1 and H4 invention also relates to a recombinant adeno-associated virus (AAV) ecomprising dystrophin minigene operably linked to an expression control element. The dystrophin minigene in operable linkage with an expression control element, in a recombinant adeno-associated virus or retrovirus is dystrophy (BMD) in a mammalian subject. The present sequence is AAV ector plasmid construct containing human dystrophin minigenes, a muscle creatine kinase (MCK) promoter and a small polya signal sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to an isolated nucleotide sequence encoding a dystrophin minigene. The minigene comprises N-terminal or modified N-terminal domains, rod repeats, utrophin or a spectrin gene, H and H4 domains and cysteine-rich domains of dystrophin or utrophin genes. The invention also relates to a recombinant adeno-associated virus (AAV) invention also relates to a recombinant adeno-associated virus (AAV) comprising dystrophin minigene operably linked to an expression control element, The dystrophin minigene in operable linkage with an expression element, in a recombinant adeno-associated virus or retrovirus is control element, in a recombinant adeno-associated virus or retrovirus is useful for treating Duchenne muscular dystrophy (DMD) and Becker muscular dystrophy (BMD) in a mammalian subject. The present sequence is AAV vector plasmid construct containing human dystrophin minigenes, a cytomegalovirus (CMV) promoter and a small polyA signal sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New dystrophin minigene for treating Duchenne or Becker muscular dystrophy comprises an N-terminal domain or modified N-terminal domain, rod repeats, HI and H4 domains and a cysteine rich domain of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       121 GCCTTTGGAAGGACTAGAGAACTCTACCAGGAGCCCAGAGAGCTGCCTCCTGAGGAGAG 180

New dystrophin minigene for treating Duchenne or Becker muscular dystrophy comprises an N-terminal domain or modified N-terminal domain, rod repeats, H1 and H4 domains and a cysteine rich domain of a

Example 1; Page 59-60; 71pp; English.

The present invention relates to an isolated nucleotide sequence encoding a dystrophin minigene. The minigene comprises N-terminal or modified N-terminal domains, rod repeats, utrophin or a spectrin gene, H1 and H4 domains and cysteine-rich domains of dystrophin or utrophin genes. The invention also relates to a recombinant adeno-associated virus (AAV) comprising dystrophin minigene operably linked to an expression control element. The dystrophin minigene in operable linkage with an expression control element, in a recombinant adeno-associated virus or retrovirus is useful for treating Duchenne muscular dystrophy (BMD) and Becker muscular dystrophy (BMD) in a mammalian subject. The present sequence is AAV vector plasmid construct containing human dystrophin minigenes, a muscle creatine kinase (MCK) promoter and a small polyA signal sequence.

```
The present invention relates to an isolated nucleotide sequence encoding a dystrophin minigene. The minigene comprises N-terminal or modified N-terminal domains, rod repeats, utrophin or a spectrin gene, Hi and H4 domains and cysteine-rich domains of dystrophin or utrophin gene, The invention also relates to a recombinant adeno-associated virus (AAV) comprising dystrophin minigene operably linked to an expression control element. The dystrophin minigene in operable linkage with an expression control useful for treating Duchenne muscular dystrophy (BMD) and Becker muscular dystrophy (BMD) in a mammalian subject. The present sequence is AAV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New dystrophin minigene for treating Duchenne or Becker muscular dystrophy comprises an N-terminal domain or modified N-terminal domain, rod repeats, H1 and H4 domains and a cysteine rich domain of a dystrophin gene -

WPI; 2000-100771/09. P-PSDB; AAY59238. gene encoding a shortened dystrophin - useful for the treatment of muscular dystrophy

Claim 7; Page 16-17; 44pp; Japanese.

The invention provides a gene for the treatment of muscular dystrophy having at least one rod repeat structure of hinge 1, hinge 4 and rod domain of dystrophin gene and having a base sequence of 4.5 kb. The gene and a gene-introducing medium consisting of an adeno-associated virus (AAV) vector or lentivirus vector containing the rod shortened dystrophin genes can be used for the genetic treatment of muscular dystrophy of low The present sequence represents a rod shortened dystrophin encoding sequence.

Sequence 4402 BP; 1329 A; 1000 C; 1019 G; 1054 T; 0 other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        a dystrophin minigene. The minigene comprises N-terminal or modified N-terminal domains, rod repeats, utrophin or a spectrin gene, H and H4 domains and cysteline-rich domains of dystrophin or utrophin genes. The comprising dystrophin minigene operably linked to a repression control element, in a recombinant adeno-associated virus (AAV) comprising dystrophin minigene in operable linked to a repression control control element, in a recombinant adeno-associated virus or retrovirus is useful for treating Duchenne muscular dystrophy (BMD) in a mammalian subject. The present sequence is human dystrophin minigene delta347 containing nucleotides 1-1992 (N-terminus, hinge H1 and rods R1, R2 and R3), R3 (M49-1027) (rod R24, hinge H4 and hinge H1 and rods R1, R2 and R3), R3 (M49-1027) (rod R24, hinge H4 and

/note—"Organ: Eye; Vector: pSPORT1; Neural retina tissue was dissected from two 80 year old donors with no observed eye disease. 100ug of total RNA was used for library construction. A directionally cloned cDNA library in the pSPORT1 vector (Life Technologies) was constructed at Bioserve Biotechnology (Laurel MD) essentially following the protocols of the SuperScript Plasmid System full details of which are contained in the manufacturer's Instruction manual (http://www.lifetech.com/). First strand synthesis was carried out using a Not I primer-adapter [5'-pGACTACTTCTACATCCGACGGCCCCC(T)]. EST analysis was performed on the unamplified library at the NIH Intramural Sequencing Center (NISC)."
Wistow,G., Bernstein,S.L., Wyatt,M.K., Ray,S., Behal,A., Touchman,J.W., Bouffard,G., Smith,D. and Peterson,K.
Expressed sequence tag analysis of human retina for the NEIBank project: Retbindin, an abundant, novel retinal cDNA and alternative splicing of other retina-preferred gene transcripts
Mol. Vis. 8 (4), (2002) In press

Double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified py773 vector. Library is normalized. Library was constructed by Bento Soares and M. Fatima Bonaldo. " 151 c 132 g 128 t
